

BK GSM-1001SMS

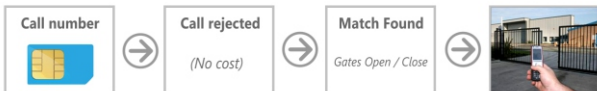

BIKAL GSM GATE OPENER

What is the GSM Gate Opener?

Inside the GSM Gate Opener housing is a mobile phone connected to the GSM networks via a SIM card. That means it has a phone number which can be used to control it.

How does the GSM Gate Opener work?

When a call arrives, the GSM Gate Opener is designed to drop the call on the first ring and then make a decision as to whether to switch the onboard relays.

SPECIFICATIONS

Capacity	1000 phone numbers storage
Counter	Gate operation and SMS counter
Notifications	Can be configured to send out notification SMS for all or specific activities
Configuration Method	Via SMS
Power	12 Volts - DC

Depending how the GSM Gate Opener is configured, a number of things will happen. If the number that just 'called' is known, a relay pulse is generated to allow gates, doors or barriers to be opened.

If the GSM Gate Opener is set to 'door' mode, the incoming call is ignored and the unit will only respond to text messages in order to give added security to garage and shutter doors.

Does it cost to use the GSM Gate Opener?

If the GSM Gate Opener is only taking calls and not sending reports, there are no usage costs. No call is ever answered and no texts messages are sent, therefore it is completely FREE to use.

If notification texts are enabled on the device, then network SIM rates are applicable.

What can be controlled with the GSM Gate Opener?

- Gates
- Barriers
- Turnstiles
- Road Blocks
- Doors
- Shutter Doors
- Garage Doors
- Lighting
- Heating
- Air Conditioning
