

# Historical Structure Surveillance application

Countries will have multiple threats to their historical structures as they open them to the public. The range of the threat is from a tourist dropping litter, chewing gum on the floor, to terrorist attacks, similar to the attacks in Mumbai. These historical buildings provide an important venue for the public to see but then also create the maximum publicity when attacked by terrorists.

Applying modern technology to historical buildings has never been easy, due to the aesthetics of the equipment and also the installation of it. Specific equipment and installers need to be applied in considering security for these monumental buildings.

## •Benefits

- Use wood look casings and housings for the cameras to blend in with the building
- Use of wireless technologies for installing the cameras and the recorders and remove the need for wiring
- Integrate access control, ticketing, x-ray machinery, face detection, number plate recognition and others for full crowd management
- Use the video and software to manage the crowds and protect against excessive wear and tear

## Features

- Unlimited number of cameras
- Smart phone access of the cameras
- Video analytics software for object counting – track the numbers exiting and entering the premises
- Integrates with existing infrastructure
- Apply remote cameras with on board recording when connectivity to central servers is not possible
- Unlimited storage of images
